Claim 17; Page 64; 88pp; English. Cancer antigen NY ESO1/CAG-3.

This sequence represents cancer peptide ESO10-127 that corresponds to amino acid residues 127-136 of human ESO-1/CAG-3 (or CAG-3) ORF1 (see AAV5596), a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides derived from CAG-3 ORF1, CAG-3 ORF2 (see AAV5966), portions of them and their against cancer. The invention provides: vectors and host cells (also useful as vaccines); a method of diagnosis of cancer or precancer; a transgenic animal; antisense oligonucleotides that inhibit expression of

prostate, ovarian, pancreatic and thyroid cancers

```
ö
cancer peptide or tumour antigen; antibodies reacting with a CAG-3 cancer peptide, useful in diagnostic and detection assays; and methods for preventing or inhibiting cancer by administering a cancer peptide, with or without an HiA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, kidney cancer, and adenocarcinomas such as breast, prostate, ovarian, pancreatic and thyroid cancers. Melanoma is treated by inducing cancer-specific T cells in vitro for subsequent

This peptide was identified as an HLA peptide motif following a screen for epitopes from the coding region of human NY ESO-1/CAG-3 ORF1 (see AAXS8S99). 30 Epitopes (see AAYOS988-Y06017) were identified. The present peptide (ranked 1) corresponds to amino acid residues 127-136 of CAG-1 ORF1 (see AAXOS965). CAG-1 is a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides (see AAXOS967-87) derived from CAG-3, portions of CAG-3 and their variants, are useful as cancer vaccines. A claimed method of preventing or inhibiting cancer involves administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lampoma, lamp cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast,

```
The invention relates to the identification and isolation of major histocompatibility (MHC) class II restricted T cell epitope (MHC-II epitope) derived from the cancer antigen, NY ESO-1 The MHC-II epitopes from the cancer antigen, NY ESO-1 and human leucocyte from NY ESO-1 are recognised by CD4+ T lymphocytes in an human leucocyte antigen (HLA) class II restricted manner, in particular HLA-DR or HLA-DR 
                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human NY ESO-1 peptide #22 to characterise epitope recognised by TE4-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New NY-ESO cancer peptide or MHC class II restricted T cell epitopes, useful as immunogen and vaccine for inhibiting cancer in a mammal or

The invention relates to the identification and isolation of major histocompatibility (MHC) class II restricted T cell epitope (MHC-II epitope) darived from the cancer antigen, NY ESO-1. The MHC-II epitopes from NV ESO-1 are recognised by CD4+ T lymphocytes in an human leucocyte antigen (HLA) class II restricted manner, in particular HLA-DP restricted. The products of the gene are promising candidates for immunotherapeutic strategies for the prevention, treatment and diagnosis of patients with cancer. The cancer epitopes are useful as immunogen and vaccine to inhibit or to prevent cancer in a mammal by aliciting CD4+ T lymphocytes resulting in protection of the recipient from development of cancer and protection from metastasis, or by inhibiting the growth of calls expressing the NY-ESO-1 gene product. The cancer peptides are also useful as diagnostic agent to detect the presence of cancer, to enhance the generation of antibody and/or CD8+ T cell responses against any given target antigen and/or happen and to induce tumour-specific humoralment arget antigen and/or happen and to induce tumour-specific humoralment restricted T cell epitope of human NY ESO-1 protein

The invention relates to the identification and isolation of major histocompatibility (MHC) class II restricted T cell epitope (MHC-II epitopes) darived from the cancer antigen, NY 850-1. The MHC-II epitopes (C from NY 850-1 are recognised by CD4 T lymphocytes in an human leucocyte antigen (HLA) class II restricted manner, in particular HLA-DR or HLA-DP creaticted. The products of the gene are promising candidates for HLA-DP creaticted. The products of the gene are promising candidates for immunotherapeutic strategies for the prevention, treatment and diagnosis of patients with cancer. The cancer epitopes are useful as immunogen and vaccine to inhibit or to prevent cancer in a mammal by eliciting CD4+ T lymphocytes resulting in protection of the recipient from development of cancer and protection from metastasis, or by inhibiting the growth of cancer and protection from metastasis, or by inhibiting the growth of cancer and protection agent to detect the presence of cancer, to enhance the generation of antibody and/or CD8+ T cell responses against any given the generation of happen and/or hapten and to induce tumour specific humoral-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New NY-ESO cancer peptide or MHC class II restricted T cell epitopes, useful as immunogen and vaccine for inhibiting cancer in a mammal or as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mediated immunity against cancer. The present sequence is MHC class II restricted T cell epitope of human NY ESO-1 protein

Human NY ESO-1 peptide #20 to characterise epitope recognised by TE4-1.

(first entry)

06-NOV-2001

Human, major histocompatibility complex; MHC; vaccine; metastasis; class II restricted T cell epitope; MHC:II epitope; cancer antigen; NY ESO-1 protein; CD4+ T lymphocyte; human leuccoyte antigen; HLA; tumour-epecific humoral-mediated immunity; cancer; cytostatic;

```
The invention relates to the identification and isolation of major histocompatibility (MHC) class II restricted T cell epicope (MHC-II epitope) derived from the cancer antigen, NV ESO-I. The MHC-II epitopes from W ESO-I are recognised by CD+T lymphocytes in an human leucocyte antigen (HLA) class II restricted manner, in particular HLA-DR or HLA-DR restricted. The products of the gene are promising candidates for immunotherapeutic strategies for the prevention, treatment and diagnosis of patients with cancer. The cancer epitopes are useful as immunogen and vaccine to inhibit or to prevent cancer in a mammal by eliciting CD+T lymphocytes resulting in protection of the recipient from development of cancer and protection from metastasis, or by inhibiting the growth of cancer peptides are also useful as diagnostic agent to detect the presence of cancer, to enhance the generation of antibody and/or CD8+T cell responses against any given
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ав
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mediated immunity against cancer. The present sequence is MHC class II restricted T cell epitope of human NY ESO-1 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New NY-ESO cancer peptide or MHC class II restricted T cell epitopes, useful as immunogen and vaccine for inhibiting cancer in a mammal or

The invention relates to the identification and isolation of major (histocompatibility (MHC) class II restricted T cell epitope (MHC-II epitopes) derived from the cancer antigen, NY ESO-1. The MHC-II epitopes crowing the cancer antigen, NY ESO-1 are recognised by CD4+ T lymphocytes in an human leucocyte antigen (HLA) class II restricted anner, in particular HLA-DR or HLA-DR crestricted. The products of the gene are promising candidates for immunotherapeutic strategies for the prevention. Leatment and diagnosis of patients with cancer. The cancer the recipient as immunogen and vaccine to inhibit or to prevent cancer in a mammal by eliciting CD4+ T clymphocytes resulting in protection of the recipient from development of cancer and protection from metastasis, or by inhibiting the growth of cancer and protection from metastasis, or by inhibiting the growth of cancer and protection from metastasis, or by inhibiting the growth of useful as diagnostic agent to detect the presence of cancer, to enhance the generation of antibody and/or CD8+ T cell responses against any given target antigen and/or hapten and to induce tumour-specific humoral.

CC peptide used in the characterisation of the NY ESO-1 epitope recognised by TE4-1

New NY-ESO cancer peptide or MHC class II restricted T cell epitopes, useful as immunogen and vaccine for inhibiting cancer in a mammal or as

The invention relates to the identification and isolation of major histocompatibility (MHG) class II restricted T cell epitope (MHG-II epitope) derived from the cancer antigen, NV ESO-I. The MHG-II epitopes from NV ESO-I are recognised by CD4+ T lymphocytes in an human leucocyte antigen (HLA) class II restricted manner, in particular HLA-DR or HLA-DP restricted. The preducts of the gene are promising candidates for immunotherapeutic strategies for the prevention, treatment and diagnosis of patients with cancer. The cancer epitopes are useful as immunogen and vaccine to inhibit or to prevent cancer in amammal by eliciting CD4+ T lymphocytes resulting in protection of the recipient from development of cancer and protection from metastasis, or by inhibiting the growth of cancer and protection from metastasis, or by inhibiting the growth of cancer and protection from metastasis, or by inhibiting the growth of the generation of antibody and/or CD8+ T cell responses against any given target antigen and/or hapten and to induce tumour-specific humoral mediated immunity against cancer. The present sequence is human NV ESO-I peptide used in the characterisation of the NV ESO-I epitope recognised
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

tumour antigen, NY-ESO-1 (AAYS2430) which can bind to MHC(major historiality Class II HIA-DRS3 molecules, thereby stimulating proliferation of helper T-cells. GNA encoding NY-ESO-1 was initially isolated from an oesophagus squamous cell cancer CDNA library. Tissue localisation studies revealed it to be expressed at high levels in normal covary and testis but not in normal colon, kidney, liver, brain, oesophagus and skin. It was expressed in certain tumours and tumour cell lines with some degree of frequency - these included melanoma specimens and cell lines, and breast and bladder cancer specimens, with expression in other tumour types being sporadic. These NY-ESO-1-derived peptides may be used in methods and compositions used for the treatment, diagnosis and preast encer, specimens, ovariant and encer, thyroid cancer, prostate cancer, lung cancer, hepatoma, ovarian cancer, thyroid cancer, bladder cancer, or lymphoma) and to stimulate the proliferation of T cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, NY-ESO-1; HLA; human leukocyte antigen; CTL; cytotoxic T cell;
HLA-A2; HLA-DR53; melanoma; adenocarcinoma; bladder carcinoma;
non-small cell lung carcinoma; tumour status determination.

The method comprises assaying a sample taken from the patient for antibodies that specifically bind to the NY-ESO-1 and comparing the value obtained to a prior value obtained from assay of a prior sample taken from the patient. Any difference between the values is indicative of a change in status of the cancerous condition. The method is useful for determining whether a cancerous condition is progressing, regressing or remaining stable, in particular in patients receiving treatment for a melanoma, adenocarcinoma, non-small

                                                                                                                                                                             The present sequence is given in a specification relating to a method for determining the status of a cancerous condition in a patient with a tumour that expresses NY-ESO-1. The method comprises assaying a sample taken from the patient for antibodies that specifically bind to the NY-ESO-1 and comparing the value obtained to a prior value obtained from assay of a prior sample taken from the patient. Any difference between the values is indicative of a change in status of the cancerous condition. The method is useful for determining whether a cancerous condition is progressing, regressing or remaining stable, in particular in patients receiving treatment for a melanoma, adenocarcinoma, non-small lung carcinoma or bladder carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NY-ESO-1; human; tumour rejection antigen precursor; SSX-2; MHC Class II; major histocompatibility complex; helper T cell; HLA-DR; cancer; muman leukocyte antigen-determining region; disease progression; disease carefresion; disease onset; body tissue; body fluid; enzyme label; radioactive label; monoclonal antibody.
Method useful for determining the status (e.g. progression, regression or stability of the disease) of a cancerous condition, involves determining the levels of NY-ESO-1 specific antibodies in a sample taken from a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polypeptides binding to major histocompatibility complex class II human leukocyte antigen-determining region molecule having amino acid sequence found in tumor rejection antigen precursor used for stimulating proliferation of helper T cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence represents a human NY-ESO-1 tumour rejection antigen precursor fragment which recognises and binds to HIA-DRE3. WY-ESO-1 and SGX-2 polypeptides, or fragments of, bind to major histocompatibility complex (MRC) class II molecules such as human leukocyte antigen-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

determining region (HLA-DR) molecules and stimulate proliferation of helper T cells. The peptides can be administered to an HLA-DR positive bubject in order to stimulate the helper T cells. An MHC Class II HLA-DR. WY-BSO-1/SSX-2 complex expressed on the surface of a cell or present in free form is useful for this stimulation. The nucleic acid is useful for screening for a cancerous condition, which involves contacting a subject sample to a cell line transfected with the immunorsactive cell (helper T cell), where interaction is indicative of cancer. In addition, a sample from a patient (for example, a body fluid or tissue) can be monitored for the amount of the complex present in the bloodstream. This is useful for determining regression, progression or onest of a cancerous condition. The method involves contacting the sample with a radioactive labelled or enzyme labelled monoclonal antibody which specifically binds with the

leukocyte antigen-determining region molecule having amino acid sequence found in tumor rejection antigen precursor used for stimulating proliferation of helper T cells. Polypeptides binding to major histocompatibility complex class II human

Example 13; Page 19; 62pp; English.

precursor fragment which recognises and binds to HLA-DR53. NY-ESO-1 and SSX-2 polypeptides, or fragments of, bind to major histocompatibility complex (MHC) Class II molecules such as human leukocyte antigendetermining region (HLA-DR) molecules and stimulate proliferation of helper T cells. The peptides can be administered to an HLA-DR positive subject in order to stimulate the helper T cells. An MHC Class II HLA-DR-NY-ESO-1/SSX-2 complex expressed on the surface of a cell or present in sequence represents a human NY-ESO-1 tumour rejection antigen

```
free form is useful for this stimulation. The nucleic acid is useful for screening for a cancerous condition, which involves contacting a subject sample to a cell line transfected with the immunoractive cell (helper T cell), where interaction is indicative of cancer. In addition, a sample from a patient (for example, a body fluid or tissue) can be monitored for the amount of the complex present in the bloodstream. This is useful for determining regression, progression or onset of a cancerous condition. The method involves contacting the sample with a radioactive labelled or enzyme labelled monoclonal antibody which specifically binds with the

New NY-ESO cancer peptide or MHC class II restricted ${\tt T}$ cell epitopes, useful as immunogen and vaccine for inhibiting cancer in a mammal or as protection from metastasis.

Claim 84; Page 84; 134pp; English.

The invention relates to the identification and isolation of major histocompatibility (MIC) class II restricted T cell epitope (MHC-II epitope) derived from the cancer antigen, NV ESO-I. The MHC-II epitopes from NV ESO-I are recognised by CD4+ T lymphocytes in an human leucocyte antigen (HLA) class II restricted manner, in particular HLA-DR or HLA-DP restricted. The products of the gene are promising candidates for immunotherapeutic strategies for the prevention, treatment and diagnosis of partients with cancer. The cancer epitopes are useful as immunogen and vaccine to inhibit or to prevent cancer in a mammal by eliciting CD4+ T lymphocytes resulting in protection of the recipient from development of cancer and protection from metastasis, or by inhibiting the growth of cells expressing the NY-ESO-I gene product. The cancer peptides are also

```
The invention describes an isolated NY-ESO-1 peptide (I), consisting of amino acids 80-109, 87-98, 108-119, 121-132 or 143-154 of a sequence of 180 (S1) amino acids fully defined in the specification. Also described are: a composition (II) useful in stimulating a CD4 + T cell response, comprising (I) and an adjuvant; a composition (III) useful in stimulating a T cell response in a subject, comprising (I) and at least one additional peptide; an isolated nucleic acid molecule (IV) consisting of a nucleotide sequence which encodes a peptide, where the amino acid sequence is chosen from 80-109, 87-98, 108-119, 121-132 or 143-154 of 180 of (S1); an expression vector (V) comprising (IV) operably linked to a promotex; a recombinant cell (VI) comprising (IV) a recombinant cell (VII) comprising (IV) and an isolated CD4 + T cell (VIII) which crecognizes a complex of (I) and a major histocompatibility complex (MHC) class II molecule. (I) is useful for treating cancer. This is the amino acid acid sequence of a NY-ESO-1 peptide.
                                                                                                                                                                                                ö
useful as diagnostic agent to detect the presence of cancer, to enhance the generation of antibody and/or CD8+ T cell responses against any given target antigen and/or hapten and to induce tumour-specific humoral-mediated immunity against cancer. The present sequence is human NY ESO-1 HIA DR restricted T cell cancer peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cytostatic; immune stimulation; cancer; cytostatic; neoplasm; NY-ESO-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel NY-ESO-1 peptide that binds to human leukocyte antigen class II molecules, useful for treating cancer.

"Cloning and transcriptional analysis of the lipA (lipoic acid
synthetase) gene from Rhizobium etli.";

FEMS Microbiol. Lett. 149:165-172(1997)

-!- FUNCTION: Catalyzes the radical-mediated insertion of two sulfur
atoms into an octanoyl group bound to acyl carrier protein (ACP)

to produce a lipoyl group (By similarity).

-!- CATALYTIC ACTIVITY: octanoyl- [acyl-carrier protein] + 2 sulfurs =
                                                                                                                                                                 15-JUL-1998 (Rel. 36, Created)
15-JUL-1998 (Rel. 36, Last sequence update)
13-SEP-2005 (Rel. 48, Last sequence update)
Lipoyl synthase (EC 2.8.1. -) (Lipoic acid synthase) (Lipoate synthase)
(Lipoyl acyl-carrier protein synthase) (Sulfur insertion protein lipA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                               lipoyl-[acyl carrier protein]
-!-CORACTOR: Binds 1 4Fe-4S cluster coordinated with 3 cysteines and an exchangeable S-adennosyl-L-methionine (By similarity).
-!-COFACTOR: Binds 1 3Fe-4S cluster (Potential).
-!-PATHWAY: Liboate biosynthesis; sulfur-insertion step.
-!-STMILARITY: Belongs to the biotin and lipoic acid synthetases

-!- FUNCTION: Catalyzes the radical-mediated insertion of two sulfur atoms into an octanoyl group bound to acyl carrier protein (ACP) to produce a lippyl group (By similarity).

-!- CATALYTIC ACTIVITY: octanoyl-[acyl-carrier protein] + 2 sulfurs = lippyl-[acyl-carrier protein].

-!- COFACTOR: Binds 1 4Fe-4S cluster coordinated with 3 cysteines and an exchangeable S-adenosyl-L-methionine (By similarity).

-!- COFACTOR: Binds 1 3Fe-4S cluster (Potential).

-!- ATMINAY: Lippoate biosynthesis; sulfur-insertion step.

-!- SUBCELLULAR LOCATION: Cytoplasmic (Potential).

-!- SUBCELLULAR EDORGATION: Cytoplasmic (Potential).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MUCLEOTIDE SEQUENCE [LARGE SCALE GENOMIC DNA].

Homo sapiens. WO9918206-A2. This peptide was identified as an HLA peptide motif following a screen for epitopes from the coding region of human ESO-1/CAG-3 ORF1 (see AAXS6859). 30 Epitopes (see AAXO5988-Y060/17) were identified. The present peptide (ranked 28) corresponds to amino acid residues 53-62 of CAG-1 ORF1 (see AAXO5965). CAG-1 is a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides (see AAXO5967-87) derived from CAG-3, portions of CAG-3 and their variants, are useful as cancer vaccines. A claimed method of preventing or inhibiting cancer involves administering a cancer peptide, with or

Cancer antigen NY ESO1/CAG-3.

```
The present sequence represents a cancer peptide that is based on amino acid residues 55-62 of human ESO-1/CAG-3 (or CAG-3) ORF1 (see AAY05965), a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells Cancer peptides derived from CAG-3 ORF1, CAG-3 ORF2 (see AAY05966), portions of them and their variants (see AAY05967-67), are useful as cancer vaccines that protect against cancer. The invention provides: vectors and host cells (also useful as vaccines); a method of diagnosis of cancer or precancer; a transgenic animal; antisense oligonucleotides that inhibit expression of the cancer peptide or triumour antigen, antibodies reacting with a CAG-3 cancer peptide, useful in diagnostic and detection assays; and methods for preventing or inhibiting cancer by administering a cancer peptide, with or without an Ham molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcona, lung cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast,
                                                                                                                                                                                         ö
without an HLA molecule. The cancer peptides form part of, or are derived
             from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and thyroid cancers
                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The protein is used for treating a disorder characterized by expression of MAGE-A1 such as cancers e.g. melanomal, squamous cell carcinomas, colorectal carcinomas, osteoastromas, and lymphocytic leukemias. Peptides derived from the MAGE-A1 HIA binding protein are useful in the production
prostate, ovarian, pancreatic and thyroid cancers. Melanoma is treated by inducing cancer-specific T cells in vitro for subsequent return to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAB31302-59 represent exemplary antigens which are characteristic of tumours. They can be used to enhance the immune response of vaccines comprising peptides derived from human MAGE-A1 HIA (human leukocyte antigen) class II-binding protein. Peptides derived from the MAGE-A1 HIA binding protein stimulate the activity and proliferation of CD4+ I lymphocytes. The MAGE-A1 HIA binding protein is useful as a diagnostic agent for diagnosing a disorder characterized by expression of MAGE-A1.
                                                                                                                                                                                                                                                                                                                                                                                           Exemplary antigen characteristic of tumours and derived from NY-ESO-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Van Der Bruggen P;

The invention relates to the identification and isolation of major histocompatibility (MHC) class II restricted T cell epitope (MHC-II epitopes) derived from the cancer antigen, NY 850-1. The MHC-II epitopes from NY 850-1 are recognised by CD4+ T lymphocytes in an human leucocyte antigen (HLA) class II restricted manner, in particular HLA-DR or HLA-DP crestricted. The products of the gene are promising candidates for immunotherapeutic strategies for the prevention, treatment and diagnosis of patients with cancer. The cancer epitopes are useful as immunogen and vaccine to inhibit or to prevent cancer in a mammal by eliciting CD4+ T cancer and protection from metastasis, or by inhibiting the growth of cancer and protection from metastasis, or by inhibiting the growth of cancer and protection from metastasis, or by inhibiting the growth of cancer and protection agent to detect the presence of cancer, to enhance the generation of antibody and/or CD8+ T cell responses against any given the generation and/or hapten and to induce tumour-specific humoral-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New NY-ESO cancer peptide or MHC class II restricted T cell epitopes, useful as immunogen and vaccine for inhibiting cancer in a mammal or as protection from metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 mediated immunity against cancer. The present sequence is MHC class I restricted human NY ESO-1 cancer peptide

The invention relates to a new polynucleotide capable of expressing an epitope-beta 2m fusion protein useful for generating cytotoxic T lymphocyte (CTL) responses against a tumour or in reservania antigen presentation in the tumour of a host. Also included are a polynucleotide capable of expressing an epitope-beta_2m fusion protein in combination with a vaccination agent that stimulates a CTL response against the ceptope of the fusion protein for simultaneous, separate or sequential use in the treatment of cancer and a method of treating a tumour by administering a capable of expressing an epitope-beta 2m fusion protein, and optionally a vaccination agent that stimulates a CTL response against the epitope of the fusion protein. The polynucleotide is useful for generating CTL responses against tumours, for restoring antigen as gastrointestinal tumour, prostatic, testicular, lung or breast cancer, malignant melanoma, mesothelioma, brain tumour, ovarian cancer, uterine as gastrointestinal tumour, prostatic, testicular, lung or breast cancer, cancer including cervical cancer, cancer of the head and neck, bladder cancer, Kaposi's sarcoma, sarcomas, osteosarcoma, renal carcinoma, and haematopoletic malignant tumours such as leukaemia and lymphoma. The headenstopoletic malignant tumours such as leukaemia and lymphoma. The epitope is an HLA (human leukocyte antigen) peptide derived from a viral or tumour antigen. The present sequence is a tumour HLA epitope used in the fusion proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100.0%; Score 55; DB 5; Length 10; 100.0%; Pred.                                                                                                                                                                                                                                                                              Identifying a cell that differentiates into a metastatic cancer cell, useful for preventing metastatic cancer, comprises identifying a mutated fibronectin in the cell.
                                                                                                                                                                                                                                                                                                                                      The invention comprises a method for identifying a cell that will differentiate into a metastatic cancer cell, the method involves identifying a mutated fibronectin in the cell. The method of the invention is useful for preventing metastatic cancer. The present amino acid sequence represents a Class I HLA-restricted testis cancer antigen.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        inverted microsomes from an animal cell (or its membrane fragments), in association with an externally disposed peptide antigen and a protein of the himent. The vaccine composition of the invention is useful for the prophylaxis or treatment of: infection (e.g. viral, bacterial, yeast, fungal or protozoal), cancer (e.g. melanoma, lung adenocarcinoma, colon cancer, breast cancer or leukemia), autoimmune disease (e.g. multiple sclerosis, rheumatoid arthritis or systemic lupus erythematosus). The present amino acid sequence represents a class I HiA-restricted cancer antigen which was found to be expressed by normal spermatocytes and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                      ö
                                                                               This peptide corresponds to amino acid residues 53-63 of human NY ESO-1/CAG-3 ORF1 (see AAY05965), a new and potent tumour antigen that is capable of eliciting an antigen specific immune response by T cells. Cancer peptides (see AAY05967-87) derived from CAG-3, portions of CAG-3 and their variants, are useful as cancer vaccines. A claimed method of preventing or inhibiting cancer involves administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, utetine cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such

preventing or inhibiting cancer involves administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and thyroid cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This peptide corresponds to amino acid residues 51-62 of human NY ESO-1/CAG-3 ORPI (see AAVO5955), a new and potent tumour antigen that is capable of eliciting an antigen specific immune response by T cells. Cancer peptides (see AAVO5965-H) derived from CAG-3, portions of CAG-3 and their variants, are useful as cancer vaccines. A claimed method of preventing or inhibiting cancer involves administering a cancer peptide, with or without an HiA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lung cancer, liver cancer, leademia, uterine cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and thyroid cancers

The present sequence represents a cancer peptide that corresponds to amino acid residues 49-62 of human ESO-1/CAG-3 (or CAG-3) ORF1 (see AAVOS965), a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides derived from CAG-3 ORF1, CAG-3 ORF2 (see AAVOS966), portions of them and their CAG-3 ORF1, CAG-3 ORF2 (see AAVOS966), portions of them and their cancer recines the antiperse of cancer vaccines that protect against cancer. The invention provides: vectors and host cells (also useful as vaccines); a method of diagnosis of cancer or precancer; a cranspend animal; antisense oligonucleocides that inhibit expression of the cancer peptide or tumour antigen; antibodies reacting with a CAG-3 cancer peptide or tumour antigen; antibodies reacting with a CAG-3 cancer peptide, useful in diagnostic and detection assays; and methods cancer peptide or inhibiting cancer by administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lung cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, liver cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and thyroid cancers. Melanoma is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1/CAG-3 ORF1 (see AAY05965), a new and potent tumour antigen that is capable of eliciting an antigen specific immune response by T cells. Cancer peptides (see AAY05967-87) derived from CAG-3, portions of CAG-3 and their variants, are useful as cancer vaccines. A claimed method of preventing or inhibiting cancer involves administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or arderived from, cancers such as primary or metaetistic melanoma, thymoma, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and thyroid cancers

The present sequence represents a cancer peptide that corresponds to amino acid residues 48-62 of human ESO-1/CAG-3 (or CAG-3) ORF1 (see AAVO5965), a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides derived from CAG-3 ORF2 (see AAVO5966), portions of them and their variants (see AAVO596-87), are useful as cancer vaccines that protect against cancer. The invention provides: vectors and host cells (also useful as vaccines); a method of diagnosis of cancer or precancer; a cransgenic animal; antisense oligonucleotides that inhibit expression of the cancer peptide or tumour antigen; antibodies reacting with a CAG-3 cancer peptide or tumour antigen; antibodies reacting with a CAG-3 cancer peptide, useful in diagnostic and detection assays; and methods or preventing or inhibiting cancer by administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and thyroid cancers. Malanoma is treated by inducing cancer-specific T cells in vitro for subsequent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present sequence represents a cancer peptide that is based on amino acid residues 44-62 of human ESO-1/CAG-3 (or CAG-3) ORF1 (see AAY05965), a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides derived from CAG-3 ORF1 (See AAY05966), portions of them and their variants (see AAY05967-87), are useful as cancer vaccines that protect against cancer. The invention provides: vectors and host cells (also useful as vaccines); a method of diagnosis of cancer or precancer; a transgenic animal; antisense oligonucleotides that inhibit expression of the cancer peptide or tumour antigen, antibodies reacting with a CAG-3 cancer peptide, useful in diagnostic and detection assays; and methods for preventing or inhibiting cancer by administering a cancer peptide, with or without an HIA molecule. The cancer peptides form part of, or are derived from, cancer peptimary or metastatic melanoma, thymoma, lymphoma,

```
The invention relates to a new synthetic polypeptide (I) comprising several different segments of at least one parent polypeptide linked together in a different relativoship relative to their linked together in a different relativoship relative to their linked segments considered with the parent polypeptide and for induded are a function associated with the parent polypeptide and for induded are a synthetic polypeptide encoding and a computer system for designing the synthetic polypeptides. The synthetic polypeptides and polymucleotides considered to as a Savine. The synthetic polypeptide is useful for modulating immune responses preferably directed against a pathogen or a cancer, (e.g., cancers of the lung, breat, ovary, cervix, colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone liver, cospophagus, brain, testicle, uterus), as potentiating agents.

Compositions comprising the polypeptide may be used in the treatment or prophylaxis against virus and respiratory and respiratory syncytial virus), bacterial cuirus, Epstein-Barr virus and respiratory syncytial virus), bacterial cuirus, Epstein-Barr virus and respiratory syncytial virus), bacterial consumental, sinfluenza, Japanese encephalitis cuirus, infections caused by Neisseria, Meningococcal, Haemophilus, C. (e.g., infections caused by Plasmodium, Schistosoma, Toxoplasma and Giardial infections. The present sequence is a peptide derived from a parent protein used to construct a savine of the
                                                                                                                                                                                                                                                                                                                                                       New synthetic polypeptides having several different segments of at least one parent polypeptide linked together differently compared to the linkage in the parent polypeptide, for inducing immune response against a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 3; Fig 27; 364pp; English.
